**FINAL QUALITY REPORT
EU-SILC 2006 OPERATION**

Vilnius 2008

1. Common longitudinal European Union Indicators based on the longitudinal component of EU-SILC

The year 2006 was the second year of EU-SILC survey in Lithuania. For the two year panel EU-SILC 2005 – 2006 no longitudinal indicators are specified.

2. Accuracy

2.1. Sample design

2.1.1. Type of sampling design

The longitudinal data of EU-SILC 2005 and 2006 were the data of the first and second waves of EU-SILC in Lithuania. The longitudinal data consisted of the 3 rotational groups: second, third and fourth of year 2005 and year 2006.

Households that were selected for the survey for the first wave in 2005 divided into 4 rotational groups. First group was dropped out after 2005 operation and not included into the survey of year 2006 according to the original integrated design. A new sub-sample of households was selected to the sample of year 2006. For new sample stratified sample design was used. Residents' register was used as a sampling frame. Simple random sample of persons was used in each stratum.

2.1.2. Sampling units

The sampling units are private households.

2.1.3. Stratification criteria

The sample was divided into 7 strata: 5 largest cities, other cities and rural area. Simple random sample of non-institutional persons aged 16 and over was selected from the Residents' Register in each stratum. Household which lives in the selected person's address was surveyed.

2.1.4. Sample size and allocation criteria

The minimum effective sample size of households for Lithuania was fixed to 4000 households. To compensate the non-response there were 6450 households selected in 2005. Non-response rate was estimated using the results of EU-SILC pilot survey and Household Budget Survey.

First rotational group was dropped from 2006 sample, 2nd, 3^d, and 4th rotational groups were included in 2006 year sample. In 2006 the sample consisted of 5982 households. This number includes 3342 households, which responded to the survey in 2005 and were followed up during 2006 operation (3 rotational groups), 75 split-off households and newly selected rotational group – 2565 households.

Table 1. Sample size and household interviews

Longitudinal component	2005		2006			
	number	%	follow-up households		split households	
			number	%	number	%
used address	4837	100.0	3342	100.0	75	100.0
address existed	4709	97.4	3342	100.0	75	100.0
address not existed	128	2.6	0	0.0	0	0.0
gross sample	4709	100.0	3342	100.0	75	100.0
addresses successfully contacted	4656	98.9	3263	97.6	73	97.3
addresses not successfully contacted	53	1.1	79	2.4	2	2.7
successfully contacted address	4656	100.0	3263	100.0	73	100.0
household questionnaire completed	3342	71.8	2932	89.9	39	53.4
refusal to co-operate	988	21.2	256	7.8	28	38.4
entire household away for the duration of the fieldwork	296	6.4	72	2.2	6	8.2
household unable to respond	25	0.5	3	0.1	0	0.0
other reason	5	0.1	0	0.0	0	0.0
successful household questionnaire	3342	100.0	2932	100.0	39	100.0
interview accepted for the database	3342	100.0	2932	100.0	39	100.0
interview rejected	0	0.0	0	0.0	0	0.0

Table 2. Households and persons in the longitudinal component

	2005	2006	Total
Used address	4837	3417	8254
Successfully contacted address	4656	3336	7992
Successful and accepted interview	3342	2971	6313
Persons	9100	8261	17361
Personal interview	7430	6599	14029

2.1.5. Sample selection scheme

Within each of 7 strata simple random sample was used to select the person's address.

2.1.6. Sample distribution over time

Table3. Number of successful interview by date of interview, longitudinal component

Month	2005	2006	Total
May	1316	1476	2792
June	1691	1192	2883
July	335	297	632
August	0	6	6

2.1.7. Renewal of the sample: rotational groups

The year 2005 was the first year of the survey in Lithuania. Households that were selected for the survey for the first wave divided into 4 rational groups. First group was dropped out after 2005 operation and not included into the survey of year 2006 according to the original integrated design. A new sub-sample of households was selected to the sample of year 2006. For new sample stratified sample design was used. Population register was used as a sampling frame. Simple random sample of persons was used in each stratum.

Table4. Sample of rotational selected groups

Rotational group	2005	2006
1	1613	–
2	1612	1155
3	1613	1146
4	1612	1116
1	–	2565
Total sample	6450	5982

2.1.8. Weighting

The chapter describes the computations of weights of longitudinal EU-SILC LT 2005-2006.

2.1.8.1. Design factor

Inclusion probability of a household in each stratum of sample of first year survey in 2005 is equal:

$$\pi_{hk} = \frac{n_h m_{hk}}{N_h},$$

here m_{hk} – the number of persons in k th household aged 16 and over in h th stratum in Population Register; n_h – the number of households in h th stratum; N_h – the number of persons aged 16 and older in h th stratum.

Sample design weights are:

$$d_{hk} = \frac{1}{\pi_{hk}}.$$

2.1.8.2. Non-response adjustments at household level – first wave

To estimate household response probability logistic regression model are used. Response propensities are estimated for responding and non-responding households. Then for the each household k define variable:

$$R_k = \begin{cases} 1, & \text{if the household } k \text{ responds;} \\ 0, & \text{otherwise.} \end{cases}$$

Let define the response propensity of each household k :

$$p_k = \Pr(R_k = 1 | V_k)$$

where V_j – auxiliary variables (county group, urbanization status, age of person belonging to address), R_k is defined above.

Then the modified design weights are defined:

$$d_{hk}^{(N)} = \frac{d_{hk}}{p_k}.$$

2.1.8.3. Adjustment to external sources (calibration) – first wave

Modified design weights are calibrated, seeking for the weights, which would remain as close as possible to sample design weights and allow obtaining some exact demographic estimates – auxiliary variables:

- number of persons aged 0 and older (including newborn children) by different strata;
- number of persons by different age groups;
- number of males by different age groups.

The product of calibration procedure is the calibrated household weight sample w_k (DB090).

Household weight is assigned to each of its members: (RB050) $w_i = w_k$, $i \in k$. The DB090 weights are calculated in each rotational group separately.

The SAS macro program CLAN is used to calculate calibrated weights.

2.1.8.4. Final longitudinal weight

For the second wave of longitudinal components the following below description will be provided.

2.1.8.5. Non-response adjustments – second wave

The personal base weight at first wave $w_1^{(RB)}$ (2005) is defined:

$$w_{1i}^{(RB)} = RB060 = 4 * RB050.$$

To determine base weight $w_{2i}^{(RB)}$ of year 2006 from base weight $w_{1i}^{(RB)}$ of year 2005, we use following step:

for the each person i , who are enumerated at year 2005 and still in-scope at year 2006 define variable:

$$R_i = \begin{cases} 1, & \text{if the person successfully enumerated at year 2006} \\ 0, & \text{otherwise.} \end{cases}$$

Using logit model, define the response propensity of each person i :

$$p_i = \Pr(R_i = 1 | V_i)$$

where V_i – auxiliary variables (like strata, total disposable household income, capacity to face unexpected financial expenses, lowest monthly income to make ends meet), R_i is defined above.

Then the personal base weight of year 2006 is defined:

$$w_{2i}^{(RB)} = \frac{w_{1i}^{(RB)}}{p_i}.$$

Additionally assign the weights for new members of households:

- a) children born to sample women receive the weight of the mother.

- b) persons, moving into sample households from outside the survey population, receive the average of base weights of existing household members.
- c) persons, moving into sample households from other non-sample households in the population, receive zero base weight.

The longitudinal weights for 2006 (individuals in scope in 2005 and 2006) for rotational group 2, 3, 4 should be:

$$RB062^j = w_{2i} \frac{n_j}{\sum_{j=1}^J n_j}; J=2,3,4.$$

here n_j – the sample size of rotational group j , $j=2,3,4$. The longitudinal weights for 2005 are missing (flag=-2).

2.1.8.6. Adjustments to external data

Adjustment to external data was not applied.

2.1.8.7. Final longitudinal weight – see chapter 2.1.8.5

2.1.8.8. Final household cross-sectional weights

Each rotational group base weights represent the whole population. The 4 sub-samples are combined. Averages of person base weights are calculated for each household. Average household weights are calibrated. As a result we have final cross-sectional household weights.

2.1.9. Substitutions

No substitution was used.

2.2. Sampling errors

The calculations of the all standard errors were done using Jackknife method by SAS program.

Table 5. Mean, total number of observations (before and after imputation) and Standard error for income components 2005 (household & persons, weighted), longitudinal component

	Mean	Number of observations (unweighted)		Standard error
		Before imputation	After imputation	
Total household gross income (HY010)	18011	3309	3320	335.67

2.3. Non-sampling errors

2.3.1. Sampling frame and coverage errors

The sampling frame of EU-SILC survey in Lithuania was the Residents' Register. Residents' Register is updated regularly. However, not all movements of population within country are reflected, whereas not all population report about changing of address to the migration office. Consequently, the households, living in selected person's address, were surveyed. The sample was extracted 2 weeks before the fieldwork.

Percentage of non-contacted addresses by the reasons: address does not exist or is non-residential address or is unoccupied (DB120=23) out of total selected addresses – 2.6.

2.3.2. Measurement and processing errors

2.3.2.1. Measurement errors

The measurement errors originate from the questionnaire (its wording, design), the data collection method, the interviewers and the respondents. While it is impossible to avoid this type of errors completely, procedures were taken to reduce them as much as possible.

The questionnaires for EU-SILC 2005 and 2006 were developed according to the EU-SILC regulations and EU-SILC doc 65/04. The questionnaires were tested during the first wave of pilot survey conducted in 2004. Designing questionnaires for main operation errors and interviewers feedbacks from the pilot survey were considered. Also the experience from the first wave (2005) of the survey was used to improve the questionnaire for the operation 2006.

The interviewers' training was organized in each territorial statistical office in 2005 in the period between April 28 and May 6, in 2006 between April 20 and May 4. Interviewers' manual, in which presented instructions on filling in the questionnaires and detailed explanation for all income components, particularly benefits, were prepared. Special emphasis was placed on tracing rules and specifics of assigning household and person numbers in the longitudinal survey. Methodical explanations were combined with practical tests. Interviewers filled in questionnaires, our specialists checked and then mistakes were discussed. Fieldwork has started immediately after interviewers training.

Fieldwork was carried out by Households' interviewers who usually work for the other household surveys carried out by Statistics Lithuania with additionally hired temporary interviewers. Temporary staff was selected from current or former employees in regional statistical offices, or persons, formerly employed as enumerators in the Population Census or Agricultural Census. In total 158 interviewers were involved into 2005 year operation, one interviewer had an average 40 selected addresses. In total 161 interviewers were involved into 2006 year operation, one interviewer had an average 37 selected addresses.

2.3.2.2. Processing errors

Completed questionnaires were checked by specialists of the Living Standard Statistics Division of Statistics Lithuania. Necessary call-backs were made. Data were entered centrally by data entry operators in Statistics Lithuania. Blaise software was used for data entry. The computer program included the possible logical checks between questions and questionnaires, also a package of alerts (warning and error ones) related to ranges of admissible values and logical connections between questions. Coding controls were implemented in post-data-collection. After the data entry was finished the data were checked for consistency.

2.3.3. Non-response errors

2.3.3.1. Achieved sample size

Table 13. Sample size and accepted interviews by rotational groups, longitudinal component

	Rotational group 2 (R2)	Rotational group 3 (R3)	Rotational group 4 (R4)	Total
2005				
Accepted household interviews	1130	1122	1090	3342
Accepted personal interviews				
Number of persons aged 16 years and older	2520	2527	2383	7430
Sample persons	2520	2527	2383	7430
Co-resident	0	0	0	0
2006				
Accepted household interviews	1011	1004	956	2971
Accepted personal interviews				
Number of persons aged 16 years and older	2250	2269	2080	6599
Sample persons	2220	2234	2058	6512
Co-resident	30	35	22	87

2.3.3.2. Unit non-response

Address contact rate:

$$Ra = \frac{7992}{8254 - 25} \approx 0.97$$

The proportion of completed household interviews accepted for the database:

$$Rh = \frac{6313}{7992} \approx 0.79$$

Household non-response rates:

$$NRh = (1 - (Ra * Rh)) * 100 = (1 - (0.97 * 0.79)) * 100 = 23.37$$

The proportion of completed personal interviews within the households accepted for the database:

$$Rp = \frac{14029}{14111} \approx 0.99$$

Individual non-response rate:

$$NRp = (1 - (Rp)) * 100 = (1 - 0.99) * 100 = 1$$

Overall individual non-response rate:

$$* NRp = (1 - (Ra * Rh * Rp)) * 100 = (1 - (0.97 * 0.79 * 0.99)) * 100 \approx 24.14$$

2.3.3.3. Distribution of households by household status (DB110), by record of contract at address (DB120), by household questionnaire result (DB130) and by household interview acceptance (DB135)

2.4. Mode of data collection

The method for data collection was paper assisted personal interview (PAPI). If necessary, telephone interviews were allowed. Proxy interview was allowed for persons temporarily away or in incapacity. To avoid non-response within household proxy interview as an exception was allowed when it was no possibility to make personal interview and another member of household could provide the information. Some data collected by proxy interview were amended by telephone, but method of data collection was not changed in the microdata.

According to Eurostat recommendations for dealing with the individual non-response problem full/partial imputation of missing personal interviews were used.

2.5. Imputation procedure

Item non-response is mostly related employee cash or near cash income (PY010), cash benefits or losses from self-employment (PY050) and tax on Income and Social Contributions (HY140). Also few cases are related disability benefits (PY130), family/child related allowances (HY050) and interest, dividends, etc (HY090).

Deterministic methods were used for PY010G, PY050G (mean/median imputation); PY0130G, HY090G (distance matching).

Deductive methods were used for HY050G, HY140G (deductive imputation).

2.6. Imputed rent

Imputed rent variable was not calculated for year 2005 and 2006.

2.7. Company cars

The data on the private use of the company car is collected in the individual questionnaire. The questions about car mode, type, year and other are asked. The amount which person has gained is estimated using Straight Line Method.

3. Comparability

3.1. Basic concepts and definitions

The reference population

No difference to the common definition. The target population of EU-SILC is all persons living in private households within the national territory of Lithuania.

The private household definition

No difference to the common definition. The private household is defined as a person living alone or a group of people, who live together in the same private dwelling and share expenditures, including the joint provision of the essentials of living.

The household membership

No difference to the common definition.

The income reference period used

No difference to the common definition. The income reference period was a fixed twelve-month period, namely the last calendar year. In the year 2005 and 2006 operational income data were collected corresponding for the reference year 2004 and 2005.

The period for taxes on income and social insurance contributions

No difference to the common definition. Taxes on income and social insurance contributions, as well as tax repayments and receipts refer to the income reference period (corresponding year 2004 and 2005).

The reference period for taxes on wealth

No difference to the common definition. Taxes on wealth paid during the income reference period (corresponding year 2004 and 2005) were recorded.

The lag between the income reference period and current variables

For the year 2005 the lag between the end of the income reference period and current variables ranges from 4 to 7 months.

For the year 2006 the lag between the end of the income reference period and current variables ranges from 4 to 8 months.

The total duration of the data collection of the sample

For EU-SILC 2005 the fieldwork period started on 1st of May 2005 and ended on the 15th of July. Almost 90% of households were interviewed during the first 2 months and only 10.4% were interviewed in July.

For EU-SILC 2006 the fieldwork period started on 1st of May 2006 and ended on the 15th of August. 88.6% of households were interviewed during the first 2 months and only 11.4% were interviewed in July and August.

Basic information on activity status during the income reference period

This information was collected with the questionnaire by an activity calendar covering each month of the income reference period.

3.2. Components of income

3.2.1. Differences between the national definitions and standard EU-SILC definitions

Cash or near cash employee income

Sickness benefits (PY120) could not be separated from cash or near cash employee income and recorded under this variable.

No-cash employee income

All components of this variable were collected, including components which will be mandatory from 2007. Only the value related to company car were recorded under variable PY020 and were added to the calculation variables HY010, HY020, HY022 and HY023.

Cash benefits or losses from self-employment

The self-employment income was collected as the amount of money drawn out of the business for household, personal use. Income from agriculture, included in this variable, was calculated as difference of total revenue from agriculture and total expenditure on it.

Value of goods produced by own-consumption

Variable was collected but not recorded to microdata file.

Gross monthly earnings for employees

Variable was not collected because EU-SILC is not used to calculate gender pay gap.

3.2.2. The source or procedure used for the collection of income variables

Where applicable the EU-SILC income target variables were split into sub-components. The sub-components were defined according to the Lithuanian regulations and benefit system. All data related to income variables were collected from interviews.

Administrative data were used for making the survey income data more accurate or for supplementing them. In year 2005 the State Social Insurance Fund Board data have been linked to sample data and used for checking cash or near-cash employee income (PY010) and social insurance contributions (component of HY140). In year 2006 the State Social Insurance Fund Board data and the State Tax Inspectorate under the Ministry of Finance of the Republic of Lithuania data have been linked to sample data and used for checking cash or near-cash employee income (PY010), maternity and maternity/paternity allowances (component of HY050), dividends from capital investments (component of HY090), social insurance contributions and taxes on income (components of HY140).

3.2.3. The form in which income variables at component level have been obtained

In year 2005 employee cash and near-cash income (PY010), self-employment income (PY050), unemployment benefits (PY090), family/children related allowances (HY050) were collected in gross and/or net. The remaining variables were collected only in gross.

In year 2006 employee cash and near-cash income (PY010), self-employment income (PY050), unemployment benefits (PY090), family/children related allowances (HY050), interest, dividends, profit from capital investments (HY090), income received by people aged under 16 (HY110) were collected in net and/or gross. The remaining variables were collected only in gross.

3.2.4. The method used for obtaining income target variables in the required form

The gross-net/net-gross conversion was used for either gross or net was collected. Conversion algorithms were created on the bases of country tax system. All income variables that are subjected to taxation and/or social insurance contribution were recorded gross and net in to the microdata files (except for variable PY120 which included into variable PY010). Other income variables were recorded only gross.

3.3. Tracing rules

The tracing rules were applied according the document EU-SILC 065.

4. Coherence

This section will compare the EU-SILC data to Household Budget Survey (HBS), wage statistics and administrative data.

The HBS is continuous survey. The survey conducted in line with the current methodology has been carried out since 1996. The HBS uses two data collection methods combined into one: the interview conducted by an interviewer and self-registration of particular household indicators. Social and economic information on household members, their living conditions and income are collected during the interview. HBS was the data source of Laeken indicators before starting EU-SILC survey.

4.1. Comparison with external sources of income target variables and number of persons who receive income from each “income component”

Table 28. Comparison of income target variables and number of persons/households who received income components, cross-sectional component, 2005

Income component	EU-SILC 2005 (cross-sectional)	HBS 2004	Other sources*
	Average annual number of people, thousand		
Cash or near cash employee income (PY010N)	1,323.2	1,243	1,159.7
Old-age benefits (PY100)	689.6	693.7	602.5
Survivors benefits (PY110)	54.9	41.3	
Average annual number of households, thousand			
Housing allowances (HY070)	86.2	69.8	

* Wage statistics in the case of PY010 and administrative source in the case of PY100

Table 29. Comparison of income target variables and number of persons/households who received income components, longitudinal component, 2005

Income component	EU-SILC 2005 (longitudinal)	HBS 2004	Other sources*
	Average annual number of people, thousand		
Cash or near cash employee income (PY010N)	1,318.4	1,243	1,159.7
Old-age benefits (PY100)	684.1	693.7	602.5
Survivors benefits (PY110)	50.4	41.3	
Average annual number of households, thousand			
Housing allowances (HY070)	84.9	69.8	

* Wage statistics in the case of PY010 and administrative source in the case of PY100

Table 30. Comparison of income target variables and number of persons/households who received income components, cross-sectional component, 2006

Income component	EU-SILC 2006 (cross-sectional)	HBS 2005	Other sources*
	Average annual number of people, thousand		
Cash or near cash employee income (PY010N)	1,390.7	1,282.0	1,195.8
Old-age benefits (PY100)	676.8	681.1	595.6
Survivors benefits (PY110)	66.1	40.1	
Average annual number of households, thousand			
Housing allowances (HY070)	75.6	42.7	

Table 31. Comparison of income target variables and number of persons/households who received income components, longitudinal component, 2006

Income component	EU-SILC 2006 (longitudinal)	HBS 2005	Other sources*
	Average annual number of people, thousand		
Cash or near cash employee income (PY010N)	1,383.3	1,282.0	1,195.8
Old-age benefits (PY100)	66.5	681.1	595.6
Survivors benefits (PY110)	62.7	40.1	
Average annual number of households, thousand			
Housing allowances (HY070)	71.7	42.7
