## READING GUIDE

The Survey on Income and Living Conditions is conducted using a mixed-mode technique: some households are interviewed using the CAPI (Computer Assisted Personal Interview) method, while others are interviewed by telephone using the CATI (Computer Assisted Telephone Interviewing) method. An interviewer contacts the households and carries out the interview using an electronic questionnaire loaded onto a personal computer.
The questionnaire presented here is a simplified version of the one developed for the interview. For a correct reading of this simplified version, it should be emphasised that the one actually used allows to:

- automatically manage the filters and the different reference periods of the survey;
- report any inconsistencies between the answers given to the questions according to a set of incompatibility rules established in advance;
- vary the question wording according to specific characteristics of the interviewed person;
- display, where necessary, the name of the person to whom the information refers;
- automatically compute some variables useful for the interview (e.g. the number of household members or the age of the interviewee);
- provide online help to clarify the meaning of the question and/or answer modes.

The CAPI-CATI questionnaire of the Survey on Income and Living Conditions consists of a General Sheet, a Household Questionnaire and an Individual Questionnaire.
The General Sheet collects information useful to identify the household composition and the socio-demographic characteristics (sex, date and place of birth, citizenship, etc.) of all household members; some information is also collected on children under 16 years of age concerning school attendance and custody in formal or informal care services. The questions in the General Sheet are answered by a single member who has exact knowledge of the information on all the other members of the household.
The Household Questionnaire is also answered by a single household member who is able to provide information about the dwelling and the related expenses.
On the other hand, all household members aged 16 and over are required to answer the questions in the Individual Questionnaire, which collects socio-demographic and income information. Only exceptionally is the proxy interview allowed, i.e. another household member who is able to provide reliable information can answer instead of the person concerned. The version presented here refers to the direct interview. In the case of a proxy interview, the questions are the same but are asked with reference to the name/surname of the interviewed member.
The Household and the Individual Questionnaire are divided into sections, each introduced by a short text (see "Script").
Households of the selected sample are interviewed once a year for a maximum of 6 consecutive years. To shorten the interview duration, the electronic questionnaire provides the interviewee with some of the information collected in previous editions of the survey ${ }^{1}$. This information is made available using certain variables, identifiable by the suffix _PI, which assume the same name as the current corresponding variables ${ }^{2}$. In these cases, the

[^0]questions simply ask to confirm the answers previously given, thus allowing a reduction of the statistical burden. In some cases, the confirmation of some key variables can also allow the automatic recording of additional information from the previous interview. In the absence of confirmation, the question wording is similar to the one of the first round of the survey.

[^0]:    ${ }^{1}$ Variable EF. 7 in the questionnaire represents the wave (the number of years the household stays in the survey).
    ${ }^{2}$ Sometimes the values collected in the last two previous surveys (at time t-1 and t-2) are compared. The variable identifiable by the suffix _PI_C, which assumes the same name as the corresponding variable collected in the current cycle (time t), is equal to 1 if the two values are the same, 2 otherwise (i.e. at time t-1 the respondent didn't confirm data collected at time t-2).
