

## Nomenclature of IAS of Union concern - summary

Technical Note – ENV.D.2/SER/2016/0011 (v2)

Request number: TSSR-2016-008

This work has been compiled by a team of experts under the supervision of IUCN within the framework of the contract No 07.0202/2016/739524/SER/ENV.D.2 “Technical and Scientific support in relation to the Implementation of Regulation 1143/2014 on Invasive Alien Species”. The information and views set out in this note do not necessarily reflect the official opinion of the Commission. The Commission does not guarantee the accuracy of the data included in this note. Neither the Commission nor any person acting on the Commission’s behalf may be held responsible for the use which may be made of the information contained therein. Reproduction is authorised provided the source is acknowledged. This document shall be cited as:

IUCN. 2018. Nomenclature of IAS of Union concern. Technical note prepared by IUCN for the European Commission.

Date of completion: 4/1/2018

Comments which could support improvement of this document are welcome. Please send your comments by e-mail to [ENV-IAS@ec.europa.eu](mailto:ENV-IAS@ec.europa.eu).

### Introduction

Taxonomy is the science of naming and classifying organisms by using binomial nomenclature formed by the combination of the genus and species name (e.g. *Asclepias syriaca*). Today 1.78 million species of estimated 15 million species in total are distinguished and named using the same taxonomic classification system (Mace, 2004). Taxonomic information is essential for conservation planning and management. Experts from various fields conclude that taxonomy is necessary for effective decision-making for conservation and sustainable use (CBD Secretariat, 2017). Knowledge about species' taxonomy helps to identify target species and contradicts confusions. Knowledge gaps and misuse of taxonomic names can cause problems for conservationist, policymakers, legislators and many others that relies on a list of species that needs to be identified for protection as well as for restriction (Mace, 2004; Smith, Aradottir, Taylor, & Lyal, 2008). A correct list for accurate and internationally used names is fundamental for the success of any invasive species management action (Smith et al., 2008).

The Regulation (EU) No 1143/2014 on the prevention and management of the introduction and spread of invasive alien species provides a *list of invasive alien species of Union concern ('the Union list')*, which is regularly updated according to Article 4(2) (Regulation (EU), 2014). Currently the Union list consist of 49 species (26 animal species and 23 vascular plant species), which were nominated in 2016 and updated 2017 (Regulation (EU), 2016, 2017). The Union list is the major core

of the EU Regulation to combat threats of invasive species EU-wide ([http://ec.europa.eu/environment/nature/invasivealien/list/index\\_en.htm](http://ec.europa.eu/environment/nature/invasivealien/list/index_en.htm), 17.10.2017).

The aim of this work is to provide a table with the names of the 49 species of Union concern in all official EU languages, including synonyms, non-valid synonyms, older names, common names, commercial names, hybrids, varieties. Therefore, the inventory consists of:

- (1) scientific names and scientific synonyms of the species,
- (2) scientific names and scientific synonyms of all known hybrids, varieties or breeds,
- (3) invalid scientific names of the species and of all known hybrids, varieties or breed,
- (4) common names and commercial names in all 24 official EU languages.

The results are presented in two separate Microsoft Excel worksheets:

- *TSSR -2016-008 Parts 1 2 and 3 scientific names.xlsx* (hereafter: scientific names worksheet), holds information related to the scientific names.
- *TSSR -2016-008 Parts 4 Common names.xlsx* (hereafter: common names worksheet), holds the common names of the 49 species for each of the 24 official EU languages, and their names used commercially.

## Methods

### Scientific names

Key taxonomic sources, to be used for identifying validity of names, were identified through consultation with species experts within IUCN, and are listed in Annex Table 1 (and as a spreadsheet in the scientific names worksheet).

For each of the 49 species on the Union list, international and European taxonomic sources both online, and hard copy publications (listed in Annex Table 2) identified through consultation with experts within IUCN and the projects Panel and Wider Expert Network, were consulted to identify the scientific names in use. This included scientific names, synonyms, and authorities at the specific and sub-specific level, including hybrids, varieties and breeds. The original publication of each scientific name was identified where possible. These names were then cross references against the key taxonomic sources to confirm their validity. To identify if each scientific name was also used as a commercial name, an online search was undertaken (Google).

### Common and commercial names

Common names of species can be a source for confusion and misidentification of species (Grime, Hodgson, & Hunt, 2014; Klein et al., 1993). To collate a list of common names for the 49 species in all 24 EU official and working languages (listed in Annex Table 3) internet searches were undertaken to identify species lists within relevant countries, for example on institutional websites or databases. Experts within the IUCN SSC Invasive Species Specialist Group (ISSG, listed in Annex Table 4) within Europe representing each official language were then contacted and asked to review the list of common names, fill any data gaps, and identify commercially used names. An additional internet search was undertaken using the finalised list of common names and keywords (price, € or other national currency, sale, buy, pet, meat, fur, seed, aquarium) translated into each official language.

## Results & Discussion

### Scientific names

For the 49 species on the Union List (representing 33 taxonomic families, Annex Table 5) a total 862 scientific names were collated, meaning that a source listed the name in association (e.g. as a synonym, or as the accepted name) with a scientific name on the Union list.

Conflict between the scientific species name as listed in the Union list and the accepted name according to key taxonomic sources appeared in the following cases:

- *Lithobates (Rana) catesbeianus* Shaw, 1802 as listed on the Union list. Frost (2017) recognise Rana as a separate genus with 49 species (not including *catesbeianus*), and provide *Lithobates catesbeianus* (Shaw, 1802) as the species accepted name. In addition it is important to note that the species basionym/protonym is *Rana catesbeianus* Shaw, 1802, and therefore the taxonomic authority should be in brackets to indicate a movement to a different genera, i.e. (Shaw, 1802).
- *Orconectes limosus* Rafinesque, 1817, as listed on the Union list. This species was recently moved to the genus *Faxonius* (Crandall & De Grave, 2017), giving the scientific name *Faxonius limosus* (Rafinesque, 1817). In addition, the authority name for *Orconectes limosus* should be in brackets, i.e. (Rafinesque, 1817), as the basionym is *Astacus limosus* Rafinesque, 1817.
- *Orconectes virilis* Hagen, 1870, as listed on the Union list. This species was recently moved to the genus *Faxonius* (Crandall & De Grave, 2017), giving the scientific name *Faxonius virilis* (Hagen, 1870). In addition, the authority name for *Orconectes limosus* should be in brackets, i.e. (Hagen, 1870), as the basionym is *Cambarus virilis* Hagen, 1870.
- *Procambarus fallax* f. *virginialis* (Hagen, 1870), as listed on the Union list. The key taxonomic reference used for crustaceans, Crandall & De Grave (2017), do not recognise *Procambarus fallax* f. *virginialis* (Martin et al. 2010) as it is an aquarium bred parthenogenetic form of *Procambarus fallax* (Hagen, 1870) and that the ICBN excludes 'forma' for names published after 1960. However Lyko (2017) a more recent publication than Crandall & De Grave (2017), has published the name *Procambarus virginialis* Lyko, 2017 replacing the preliminary designation *Procambarus fallax* forma *virginialis* (Martin et al., 2010).
- *Tamias sibiricus* Laxmann, 1769, as listed on the Union list. This species accepted name is *Eutamias sibiricus* (Laxmann, 1769) according to the IUCN Red List, which is following a publication (Patterson & Norris, 2016) which post-dates the species record in Wilson and Reeder's Mammals Species of the World (3<sup>rd</sup> Edition), which lists *Tamias (Eutamias) sibiricus* Laxmann, 1769 as the accepted name.
- *Heracleum sosnowskyi* Mandenova, as listed on the Union list. According to the key taxonomic reference used for plants (The Plant List, 2013) the name *Heracleum sosnowskyi* Manden. derives from WCSP (in review) (data supplied on 2012-03-23) which does not establish this name either as an accepted name or as a synonym. However, according to the Catalogue of List (which cites Hassler, M. 2017. World Plants Synonymic Checklists of the Vascular Plants of the World) the name is accepted.
- *Persicaria perfoliata* (L.) H. Gross (*Polygonum perfoliatum* L.), as listed on the Union list. While not a genuine conflict, as both names are listed on the Union list, the key taxonomic source used for our research (The Plant List, 2013) lists *Polygonum perfoliatum* L. as the accepted name, and *Persicaria perfoliata* (L.) H. Gross as the synonym.

- *Pueraria montana* var. *lobata* (*Pueraria lobata* (Willd.) Ohwi), as listed on the Union list. While not a genuine conflict, as both names are listed on the Union list, the key taxonomic source used for our research (The Plant List, 2013) lists *Pueraria montana* (Lour.) Merr. var. *lobata* (Willd.) Sanjappa & Pradeep as the accepted name, and *Pueraria lobata* (Willd.) Ohwi as the synonym.

According to the International Code of Zoological Nomenclature (ICZN, <http://iczn.org/iczn/index.jsp>) Article 51.3. “*When a species-group name is combined with a generic name other than the original one, the name of the author of the species-group name, if cited, is to be enclosed in parentheses*”, therefore of the 26 animal species listed on the Union List 18 are missing the required parentheses (please see scientific names worksheet for the list of basionyms/protonyms), and should be written as follows:

- *Alopochen aegyptiaca* (Linnaeus, 1766)
- *Callosciurus erythraeus* (Pallas, 1779)
- *Eutamias sibiricus* (Laxmann, 1769)
- *Faxonius limosus* (Rafinesque, 1817)
- *Faxonius virilis* (Hagen, 1870)
- *Herpestes javanicus* (Geoffroy Saint-Hilaire, 1818)
- *Lithobates catesbeianus* (Shaw, 1802)
- *Myocastor coypus* (Molina, 1782)
- *Muntiacus reevesi* (Ogilby, 1802)
- *Nasua nasua* (Linnaeus, 1766)
- *Nyctereutes procyonoides* (Gray, 1834)
- *Ondatra zibethicus* (Linnaeus, 1766)
- *Oxyura jamaicensis* (Gmelin, 1789)
- *Pacifastacus leniusculus* (Dana, 1852)
- *Procyon lotor* (Linnaeus, 1758)
- *Pseudorasbora parva* (Temminck & Schlegel, 1846)
- *Threskiornis aethiopicus* (Latham, 1790)
- *Trachemys scripta* (Thunberg in Schoepff, 1792)

### Common and commercial names

The source identifying the common names varied from official government institutions that provides a full list of common names, to blogs where the common name is used by an individual. Often the genus name is used a common name for the species, which may cause misidentification.

For the 49 species on the Union list species, common names in each of the 24 EU official languages could only be found for one species, *Alopochen aegyptiaca*. However for an additional 28 species, common names could be identified in more than 20 languages. Many species have more than one common name per language, for example *Lithobates (Rana) catesbeianus* is known in Dutch as Amerikaanse stierkikker, Stierkikker, and Brulkikker. In a few languages (e.g. German, Dutch, Italian and English) the common names for the sub-species *Trachemys scripta troostii*, *T. scripta scripta* and *T. scripta elegans* could be differentiated for the subspecies. However, we have no way of identifying if any of the reported common names are widely known in the public or if the common name is used only by a minority, e.g. a certain stakeholder group. Further analysis of the public awareness of a species may help to record which names are the ‘primary’ common names.

The species for which no common name could be identified for the most languages were *Microstegium vimineum* (11 languages), *Persicaria perfoliata* (15 languages), and *Parthenium hysterophorus* (15 languages). The languages with the highest number of species with no common

name identified are Maltese (43 species), Romanian (31 species) and Irish (30 species). It is likely that the primary reason for the lack of a common name in many languages is due to the absence of the species within a country.

In many cases the commercial use of the species name could be identified, however it is highly likely that additional online searching, and communications with additional experts would identify more commercially used names. Therefore the information cannot be used to quantify or interpret the commercial use of the 49 species of the Union list. To reliably gather information on the trade and commerce of the species we would suggest to provide a detailed market analysis based on imported and traded quantities (Brunel, 2009). The species with the highest number of languages with commercially used names identified were *Pennisetum setaceum* (18 commercial names identified in 14 languages), *Elodea nuttallii* (15 names in 11 languages), *Eichhornia crassipes* (22 names in 10 languages), and *Impatiens glandulifera* (16 names in 10 languages).
